What is Claude Code?

Claude Code is an AI coding assistant created by Anthropic and first launched on February 24, 2025. It is a prime example of the term “supervised coding agent.”

For those unaware, these are tools that can complete fairly sophisticated tasks in a software development workflow. In some cases, they do so autonomously.

Claude Code is the best-known supervised coding agent currently available today. It is widely adopted and easily integrated into IDE-based workflows.

These include Cursor, Cline, Windsurf, and GitHub Copilot currently has agentic workflows in preview. Claude Code differs fundamentally from these as it’s a terminal-based interface.

The beauty of working through a terminal in Claude Code is that it facilitates the integration of agents within a larger ecosystem compared to being fixed to a specific IDE.

Core Capabilities of Claude Code

- **Direct File Manipulation:** Claude Code can manipulate files, including new file creation, and can manage the project structure with no manual intervention.
- **Deep Codebase Understanding:** It can understand the dependencies, patterns, and coding conventions throughout your codebase. This contextual information allows for more relevant and accurate suggestions.

Core Capabilities of Claude Code

- **Natural Language Programming:** Provide a description of what you would like to see in plain English, and Claude Code can develop implementation plans, write the code, and confirm everything works.
- **Git Workflow Integration:** Relax and let Claude Code handle complex git operations, fix merge conflicts for you, write meaningful commit messages, and manage pull requests with simple conversational commands.
- **Extensible Architecture:** Claude Code modern architecture allows it to connect to external tools, databases, and APIs, via the Model Context Protocol (MCP), allowing for flexibility among development environments.
- **Supervised Coding Agent:** Claude Code is an AI tool that helps you write, manage, and debug your code. But it works under your guidance, instead of acting fully on its own. It takes instructions from you, like fixing a bug or adding a feature, and then plans and executes the steps needed to do it. Think of it like a junior developer who can read your codebase, make edits, run tests, and even push commits, but always follows your lead.

Claude Code Installation

Before you start building with Claude Code, you need to be certain that your environment is perfectly set up for its proper use. So, you should have certain hardware and software prerequisites. This section outlines the required system requirements and provides step-by-step instructions on installing Claude’s AI coding assistant on your macOS, Linux, or Windows systems.

Systems Requirements

Here is the minimum system setup we need to run Claude Code smoothly:

Category	Requirements
Operating Systems	– macOS 10.15+ – Ubuntu 20.04+ / Debian 10+ – Windows 10+ (with WSL 1, WSL 2, or Git for Windows)
Hardware	Minimum 4GB RAM
Software	Node.js 18+ and npm
Network	Internet connection required for authentication and AI processing
Shell	Works best in Bash, Zsh, or Fish terminals

Steps to Install

To get Claude Code up and running on your local machine, follow these relatively simple steps with a few commands required.

```
npm install -g @anthropic-ai/claude-code
```

[Copy Code](#)

Important: Do not use `sudo npm install -g` as this could create permission problems or security issues. If you run into permission issues, consider using a Node.js version manager like `nvm` instead.

Once installed, you can navigate to your project directory and run Claude Code:

```
cd your-project-directory  
claude
```

[Copy Code](#)

Authentication Setup

Claude Code has multiple authentication options depending on your preference and need:

- **Anthropic Console Auth:** This is the default option if you have active billing at `console.anthropic.com`. You can complete the OAuth process by running `claude login`. If you have already done this, your session is still active until you use the Claude logout.

- **Claude App Subscription:** If you subscribe to the Claude Pro or Max plan, you have automatic access to Claude Code in addition to the web interface.
- **Enterprise Platforms:** You can also configure Code to leverage either Amazon Bedrock or Google Vertex AI credentials in your enterprise applications if you already have cloud-enabled.

Running Claude Code

In this part, we will learn how to start and interact with Claude Code inside a project. After installing it, go to your project directory in a terminal window and enter the following command:

```
claude
```

[Copy Code](#)

```
PROBLEMS 3 OUTPUT DEBUG CONSOLE TERMINAL PORTS  claude  + - [ ] [X] ... ^ X

* Welcome to Claude Code!

/help for help, /status for your current setup

cwd: /home/av/Desktop/Memeverse-main

Tips for getting started:

1. Run /init to create a CLAUDE.md file with instructions for Claude
2. Use Claude to help with file analysis, editing, bash commands and git
3. Be as specific as you would with another engineer for the best results
4. ✓ Run /terminal-setup to set up terminal integration

You can now use your Claude subscription with Claude Code • /login to activate

> Try "write a test for <filepath>"
```

Claude Code Interface

Claude will understand what you're asking for and will write the code for you. You can also ask it to explain files for you, add tests, and fix bugs. It works with all programming languages and frameworks as well.

The essential built-in commands include:

/help – displaying available commands and features

/exit – closing the Claude Code session

/clear – clear the context and the previously generated conversation

/config – shows the configuration settings

/doctor – health status of your installation and diagnosis of any potential issues

Building “Bat Dash”: A Fun Pixel-Style Game

In this section, we will demonstrate the use of Claude Code to create a fun game.

Here is the prompt that I passed to Claude.

“

Prompt: “Create an engaging Halloween-themed side-scrolling game called “Bat Dash”. The player controls a bat that can move up and down using the arrow keys or W/S keys, flying across the screen while avoiding ghosts and collecting pumpkins. Ghosts spawn from the right side of the screen and move left; if the bat touches a ghost, the game ends. Pumpkins also move from right to left, and collecting them increases the player’s score. Every 10 seconds, the game’s difficulty increases by speeding up the ghosts and adding more obstacles and pumpkins. Include a dynamic day-night cycle where the background switches from a dusk sky with clouds to a dark night with glowing stars every 20–30 seconds. The score should be displayed on screen, and when the game ends, show a “Game Over” screen with a restart button.”
